🛡 Security Rules

🤖 **AI Fundamentals**
What it can and can't do

🔐 **Security & Data Integrity**
What to never share

📄 **Document Writing**
SOP · Deviation · CAPA · Translation

⚙️ **Manager Automation**
Tool requests & workflow efficiency

> *"When systems are well-designed, people can focus on what matters most: judgment."*

Pharmaceutical QC

Using Claude Right. 🧪

A practical team guide for using Claude safely and effectively in GMP environments

📋 Table of Contents

This guide is for everyone on the GMP team — from first-time Claude users to managers building workflow tools.

CHAPTER 01 · P.03

What Claude Is — and Isn't

Capabilities · Hallucination · Limitations · Escalation to supervisors

CHAPTER 02 · P.06

Security & Data Integrity

No credentials · Veeva/LIMS/NAS · Anonymization · ALCOA+

CHAPTER 03 · P.09

Document Writing in Practice

SOP · Deviation Reports · CAPA · Translation · Review prompts

CHAPTER 04 · P.12

Workflow Automation for Managers

Tool requests · Checklists · Meeting summaries · Deviation classifier

QUICK REF · P.15

Prompt Quick Reference Card

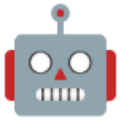

Starter lines by situation — copy and use immediately

DESIGN PHILOSOPHY

"When AI produces a wrong result, it's not the tool's failure — it's a question of how we've designed the system around it. When systems are well-designed, people can focus on what matters most: judgment."

CHAPTER 01

What Claude Is — and Isn't

Claude is powerful — but in a GMP environment, that power can become a liability if misunderstood. You need to know exactly what kind of tool you're working with.

Pattern Recognition Engine

Predicts likely next content based on learned patterns

Fast Drafting Assistant

Exceptional at structure, phrasing, formatting, and translation

Cannot Verify Facts

All figures, specs, and regulations must be independently verified

⚠️ What You Must Know First

Understanding hallucination and limitations makes Claude dramatically safer to use

🚨 CRITICAL WARNING — HALLUCINATION

Claude can confidently cite regulation numbers that don't exist, provide incorrect values, and reference non-existent documents. Every figure, regulation, and specification generated by Claude must be verified against primary sources before use in any GMP document.

✅ Do vs. Don't

✅ Use Actively

- ✓ Drafting and document structure
- ✓ Improving existing document language
- ✓ Korean ↔ English translation
- ✓ Checking logic and missing items
- ✓ Brainstorming and ideation
- ✓ Standardizing repetitive formats
- ✓ Inspection preparation checklists

🚫 Never Do

- ✗ Use regulatory figures without verification
- ✗ Input actual batch or LOT data
- ✗ Input patient or customer personal data
- ✗ Use unapproved SOPs as final documents
- ✗ Submit Claude output without review
- ✗ Share login credentials or passwords
- ✗ Input confidential process information

🏢 When You're Unsure

🙋 NON-NEGOTIABLE PRINCIPLE

Uncertain? Ask your supervisor — not Claude.

If you're unsure whether Claude's output is correct, do not ask Claude again. Contact your supervisor or QA directly. Claude has no authority to officially interpret GMP regulations. Re-prompting does not resolve genuine uncertainty.

💡 CORE PRINCIPLE

Claude is the drafting assistant. You are the final reviewer. In GMP, responsibility always rests with the person who signs. Claude's output is a starting point — never a final answer. 🎯

CHAPTER 02

Security & Data Integrity

What you choose to share — or not share — with Claude is the entire foundation of information security here. One mistake can create a serious DI issue.

🔑 **No Login Credentials — Ever**
Veeva, LIMS, NAS IDs and passwords are strictly prohibited

🧪 **No Real Analytical Data**
Batch numbers, OOS results, actual measurements

🎭 **Anonymize First, Then Input**
Replace real data with fictional scenarios before sharing

🛡 What to Never Share

Claude is an external service. Everything you type is transmitted outside the company network.

🚫 STRICTLY PROHIBITED INPUTS · DI CRITICAL

🔑 LOGIN CREDENTIALS

Email addresses, passwords

`user@company.com` `password123`

No form of login info permitted

💻 SYSTEM ACCESS INFO

- Veeva Vault ID / password
- LIMS login credentials
- NAS internal archive access

🧪 REAL ANALYTICAL DATA

- Actual batch numbers, LOT numbers
- OOS result values, real measurements
- Product names, client names

📋 CONFIDENTIAL INTERNAL INFO

- Unapproved process parameters
- Internal audit findings
- Pre-submission regulatory materials

🎭 How to Anonymize

✅ Input Like This

- ✓ "HPLC system suitability failed during analysis"
- ✓ Remove batch numbers, describe situation only
- ✓ Reference regulation sections, not specific values
- ✓ Use fictional company and product names

🚫 Not Like This

- ✕ "Batch 2024-ABC-001 had an OOS result"
- ✕ "ALT-L9 result was XX%, is that okay?"
- ✕ "My Veeva password isn't working, help"
- ✕ Include real vendor or analyst names

📊 ALCOA+ and AI

Principle	AI Usage Consideration
Attributable 📌	Even with AI drafting, the signatory takes full review responsibility
Accurate ✅	AI output cannot be assumed accurate without verification
Contemporaneous ⏰	AI summaries cannot be used as backdated records
Original 📝	AI-generated content is not an original record — review before documenting

CHAPTER 03

Document Writing in Practice

How you write your prompt determines the quality of the output. A good prompt is like a good SOP — the clearer the context, the more predictable the result.

📋 **SOP Drafts**
Structure design + section-by-section drafting

🔍 **Deviation Reports / CAPA**
Situation structuring + format auto-generation

🌐 **Translation & Review**
GMP terminology-aware translation

⚡ The Golden Prompt Structure

The foundational template for all GMP document prompts — follow this and the output quality changes immediately

🏆 BASE TEMPLATE

Universal pattern for any GMP task

📄 golden_template.txt

```
# 1. Assign a role — give Claude context
[Role] You are a GMP documentation specialist.

# 2. Clear task instruction
[Task] {what you want Claude to do}

# 3. Provide context — no real data!
[Context] {relevant background information}

# 4. Specify output format
[Format] {how you want the output structured}

# 5. Safety clause — always include this! ⚠️
[Note] Mark all figures and regulations as [VERIFY].
If unsure, do not guess — mark as [UNCERTAIN].
```

📋 SOP Draft

💡 LIVE EXAMPLE — HPLC column cleaning SOP

📄 sop_draft.txt

```
You are a GMP documentation specialist.
Draft a SOP based on the information below.

Procedure: HPLC Column Cleaning Procedure
Purpose: Extend column life and prevent contamination
Scope: QC Laboratory HPLC operators

Format:
- Include: Purpose / Scope / Responsibility /
  Procedure / Records sections
- Numbered list for each procedure step
- Cautions in a separate warning box

Mark all numeric criteria as [VERIFY]. ⚠️
```

🔍 Deviation Report

💡 LIVE EXAMPLE — Deviation report (anonymize first!)

📄 deviation_report.txt

```
Draft a GMP deviation report.

# Anonymize real data before input 🎭
Situation: HPLC system suitability failed during
analysis (no batch numbers or values)

Sections to include:
1. Deviation description (What happened)
2. Immediate action taken
3. Potential impact assessment
4. Root cause categories to investigate
5. Suggested CAPA direction

Format: Clear section headers + numbered lists
```

🌐 Translation (EN ↔ KR)

💡 LIVE EXAMPLE — GMP-context translation

📄 translation.txt

```
Translate the following text into Korean.

Target audience: GMP quality professionals

Requirements:
- Keep ICH/USP/FDA terms in original with
  Korean translation in parentheses
- Prioritize accuracy over naturalness
- Mark ambiguous expressions as
  [Translator's note: ...]

[Source text]
{paste content here}
```

🔎 Document Review

💡 LIVE EXAMPLE — SOP review request

📄 doc_review.txt

```
Review the SOP section below from a GMP perspective.

Find:
- Vague language ("appropriately", "sufficiently") 🔍
- Steps where the performer is unclear
```

CHAPTER 04

Workflow Automation for Managers

Claude can go beyond writing to help build simple tools that automate repetitive workflows. No coding required — just describe what you need.

📊 **Deviation Priority Classifier**
Auto-sort into Critical / Major / Minor

✅ **Inspection Checklists**
FDA/KFDA readiness self-assessment

📌 **Meeting Action Items**
Auto-extract owner, deadline, priority

🛠 How to Request Automation Tools

Be clear about: what the tool is for + what goes in + what comes out

📊 Deviation Priority Classifier

⚙️ MANAGER — Auto-classification tool request

```
📄 deviation_classifier.txt

Build a deviation priority classifier tool.

Input: Deviation description, date of occurrence,
       product impact (Y/N), regulatory report needed (Y/N)

Output:
| Deviation | Grade | Reason | Recommended Timeline |

Classification criteria:
- Regulatory report required → 🔴 Critical
- Product impact → 🟡 Major or above
- Otherwise → 🟢 Minor
```

✅ Inspection Readiness Checklist

⚙️ MANAGER — Self-inspection checklist

```
📄 inspection_checklist.txt

Create an FDA inspection readiness self-assessment
checklist for a QC laboratory. 📋

Scope:
- Instrument calibration and maintenance records
- Reagent and reference standard management
- Data integrity (ALCOA+ principles)
- Training records

Format: □ Item | Related Document | Owner

Mark all numeric criteria as [VERIFY]. ⚠️
```

📌 Meeting Action Items

⚙️ MANAGER — Meeting notes → Action items

```
📄 action_items.txt

Extract action items from the meeting notes below.

Output: | # | Action | Owner | Deadline | Priority |

Priority:
🔴 High (this week)
🟡 Medium (this month)
🟢 Low (next month)

[Meeting notes]
{paste notes here}
```

> 💡 **TEAM TIP**
>
> Save effective prompts to a shared team document. Reuse them across situations to lift team-wide efficiency. Always update suggested owners and deadlines to match your actual org structure. 📁

⚡ Starter Lines by Situation

Copy and use immediately — always add a [VERIFY] request at the end!

📄 SOP Draft

```
"You are a GMP documentation specialist. Draft a SOP for [procedure] with Purpose / Scope / Responsibility / Procedure / Records sections. Mark all figures as [VERIFY]."
```

🔍 Document Review

```
"Review the document below for vague language, unclear performers, and missing record requirements. Suggest clearer alternatives."
```

📋 Deviation Report

```
"Structure [anonymized situation] as a GMP deviation report with deviation description / immediate action / impact assessment / root cause categories / CAPA direction."
```

🌐 Translation

```
"Translate the following into Korean for a GMP quality professional audience. Keep ICH/USP/FDA terms in original with Korean in parentheses."
```

✅ Checklist

```
"Create a checklist for [purpose]. Format: □ Item | Related Document | Owner."
```

📌 Meeting Notes → Action Items

```
"Extract action items from the meeting notes below as a table with Owner / Deadline / Priority (H·M·L)."
```

⭐ Three Golden Rules

1 🔐 **Never input login credentials or real data**

Veeva, LIMS, NAS IDs/passwords, batch numbers, OOS results — no exceptions.

2 ✍️ **Final review and judgment must be done by you**

Claude's output is a draft. Always review personally before signing or submitting.

3 🙋 **When uncertain — ask your supervisor, not Claude**

AI has no authority to officially interpret GMP regulations. When in doubt, ask a person.

When systems are designed well, *people make better decisions.*

This guide was built so your team can use AI without fear or blind trust — just clear thinking in a GMP context.

- 🔐 Login credentials & real data — never input into Claude
- ✍️ Final review and judgment — always done by you
- 🙋 When uncertain — ask your supervisor, not Claude
